

Crop yield effect vs AMOC-weakening bin (ΔSv)

solid = spec A (fixed Mar-Jul window, benchmark)

dashed = spec C (thermal-time window)

neither total is a standalone estimate (Appendix I) –
reported together so the specification sensitivity is visible

shaded band: range across the bin's individual hosing years,
spec A only, IPSL-CM6A-LR and EC-Earth3 (Appendix I)

no ISIMIP marker on this figure – the AMOC bins and the ISIMIP

branch measure different physical quantities (Appendix J, J.4e)
