

Crop yield effect vs AMOC-weakening bin (ΔS_v)

solid = spec A (fixed Mar-Jul window, benchmark)

dashed = spec C (thermal-time window)

neither total is a standalone estimate (Appendix I) –
reported together so the specification sensitivity is visible

shaded band: range across the bin's individual hosing years,
spec A only, IPSL-CM6A-LR and EC-Earth3 (Appendix I)

triangles: ISIMIP3b/ssp126, binned by year-level AMOC (Appendix J.5),
spec A, at the ΔS_v levels it shares with NAHosMIP – IPSL and EC-Earth3 only
caveat: ΔS_v baseline differs (piControl vs historical mean), see Appendix J.5
