

Natural gas demand effect vs AMOC-weakening bin (ΔSv)

single specification (Appendix H, H.7): the energy windows are calendar constructions matching real consumption cycles, no window ambiguity

shaded band: range across the bin's individual hosing years, IPSL-CM6A-LR and EC-Earth3 only (Appendix I)

no ISIMIP marker on this figure – the AMOC bins and the ISIMIP branch measure different physical quantities (Appendix J, J.4e)

caveat (Appendix I, I.4): the AMOC bins extrapolate the linear response function up to ~ 9 s.d. beyond the range that identifies the coefficients
