

IPSL-CM6A-LR

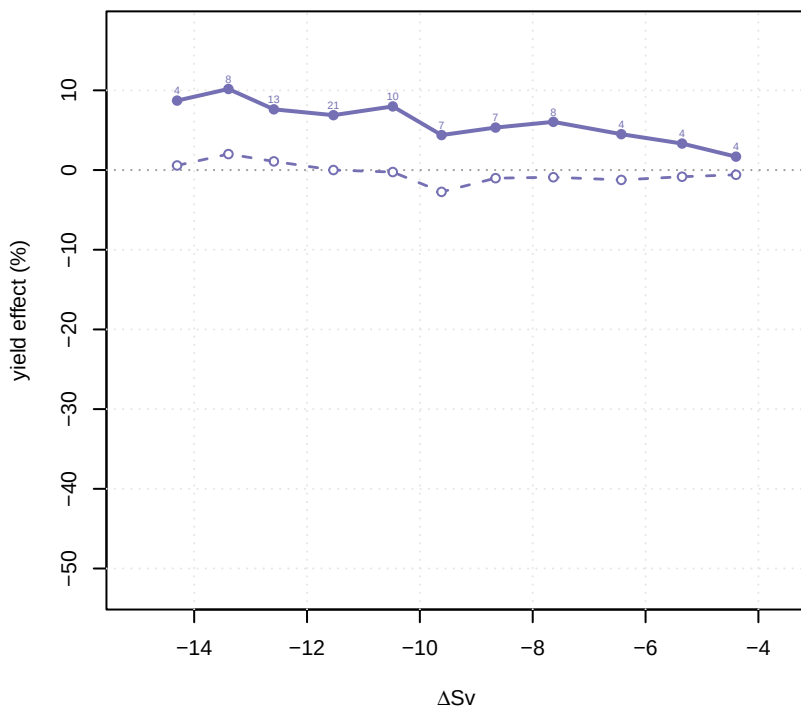

EC-Earth3

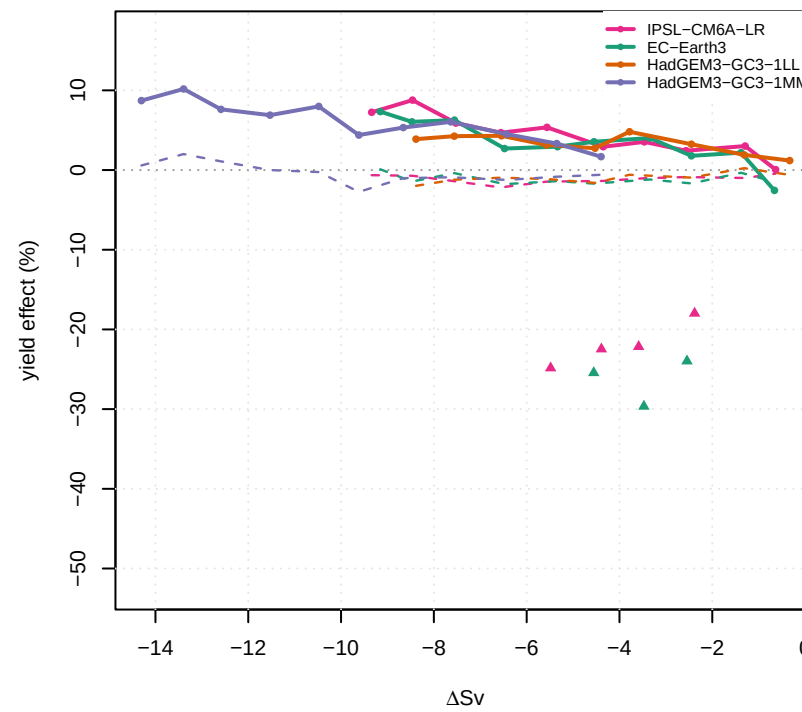

HadGEM3-GC3-1LL

HadGEM3-GC3-1MM

All models – comparison

Crop yield effect vs AMOC-weakening bin (ΔSv)

solid = spec A (fixed Mar-Jul window, benchmark)

dashed = spec C (thermal-time window)

neither total is a standalone estimate (Appendix I) –

reported together so the specification sensitivity is visible

shaded band: range across the bin's individual hosing years,

spec A only, IPSL-CM6A-LR and EC-Earth3 (Appendix I)

narrow bar (thinner): same range across the ISIMIP bin's ssp370 years (Appendix J.6)

triangles: ISIMIP3b/ssp370, binned by year-level AMOC (Appendix J.5),

spec A, at the ΔSv levels it shares with NAHosMIP – IPSL and EC-Earth3 onlycaveat: ΔSv baseline differs (piControl vs historical mean), see Appendix J.5
