

Per-cell per-month fit: share of interannual variance explained (piControl, full record)

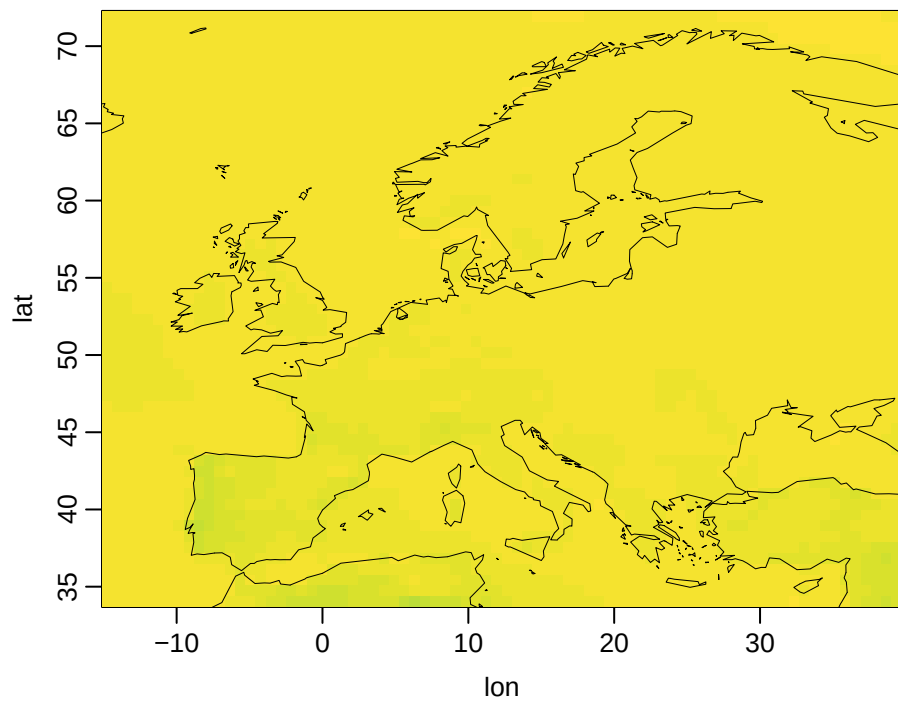

tasmin R2, median month

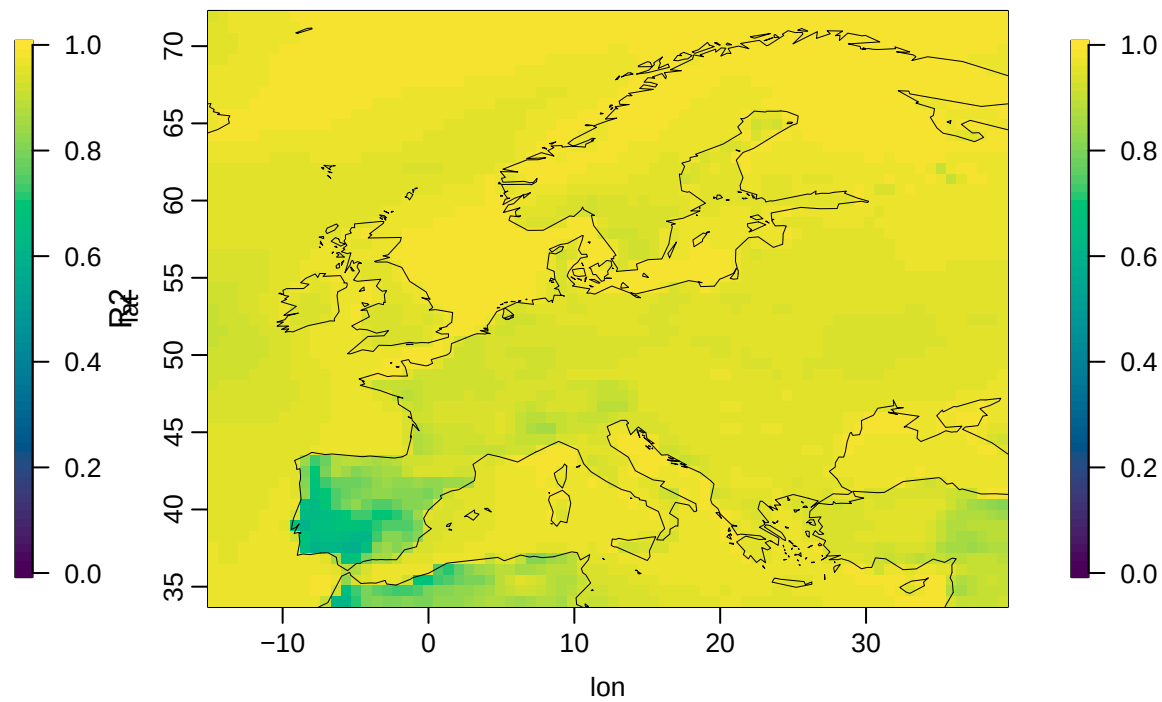

tasmin R2, worst month

tasmax R2, median month

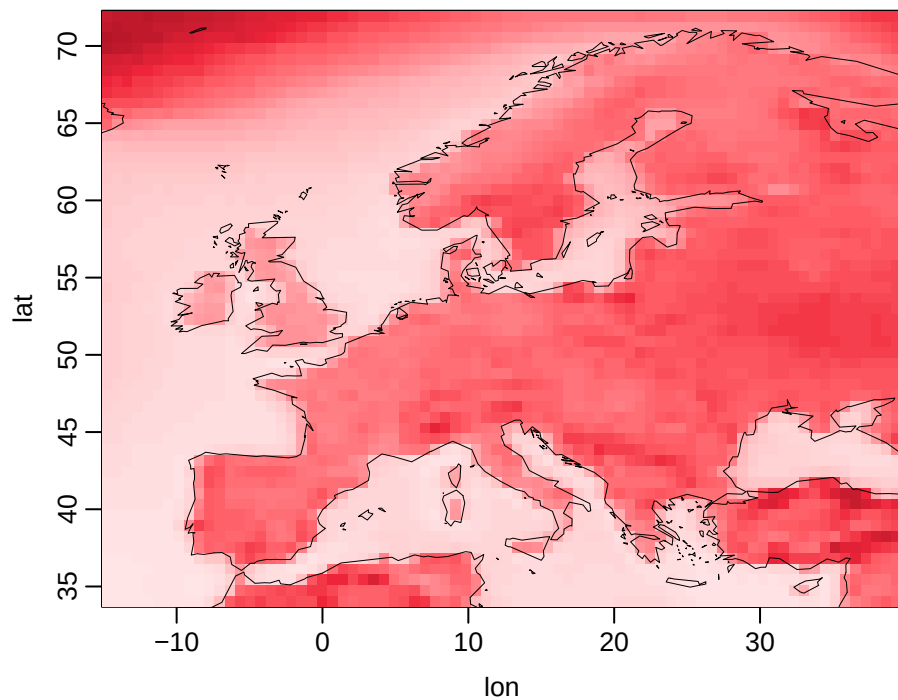

tasmax R2, worst month

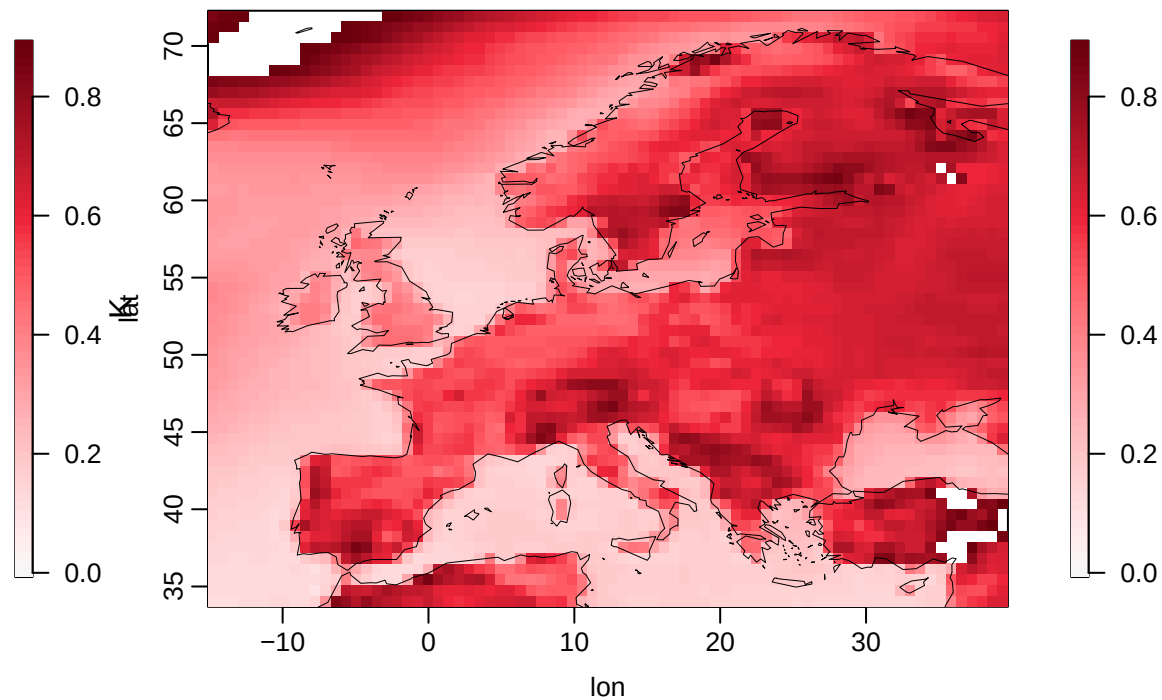

In-sample residual RMSE: the reconstruction's error scale in kelvin (low R2 + low RMSE = harmless quiet cell)

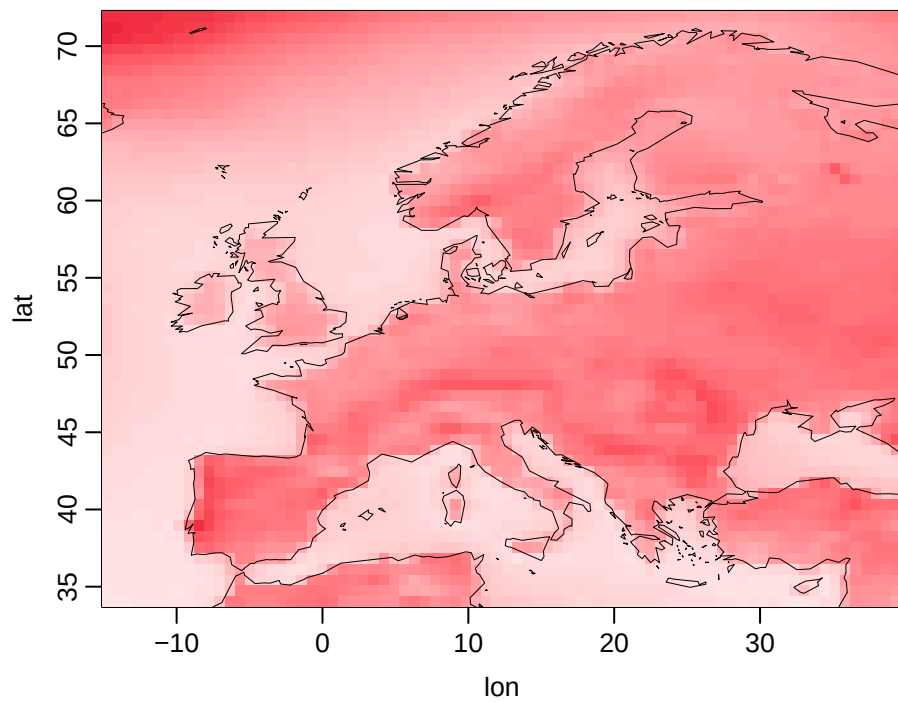

tasmin RMSE, median month [K]

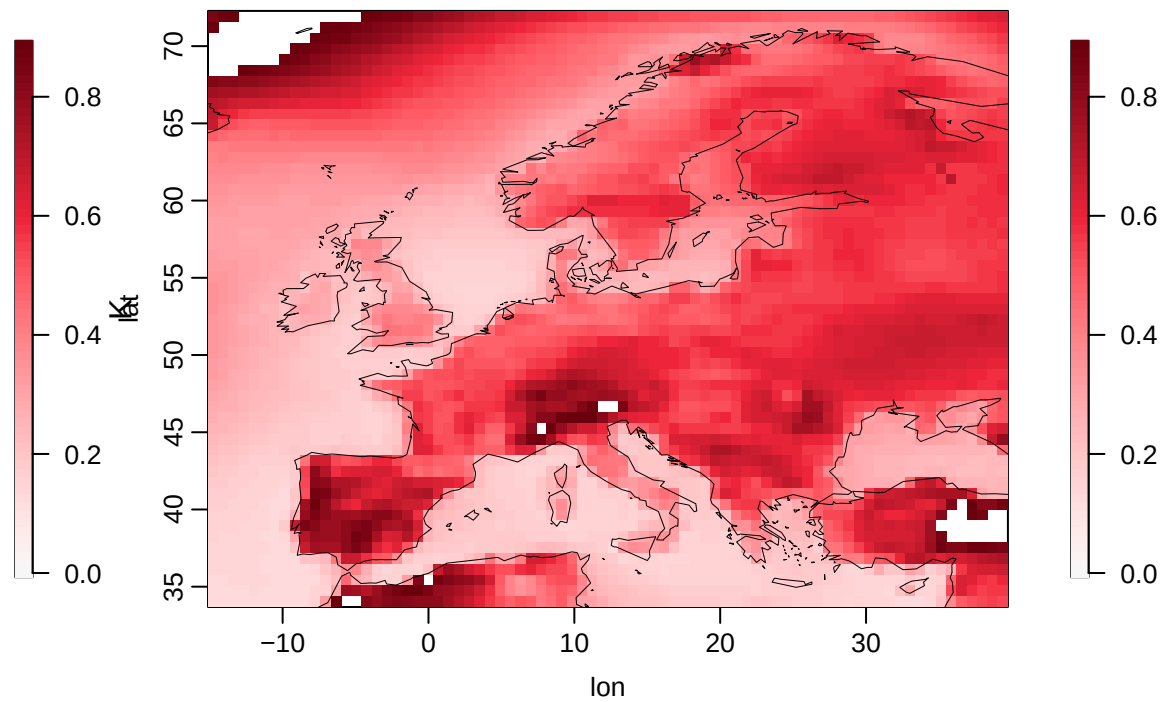

tasmin RMSE, worst month [K]

tasmax RMSE, median month [K]

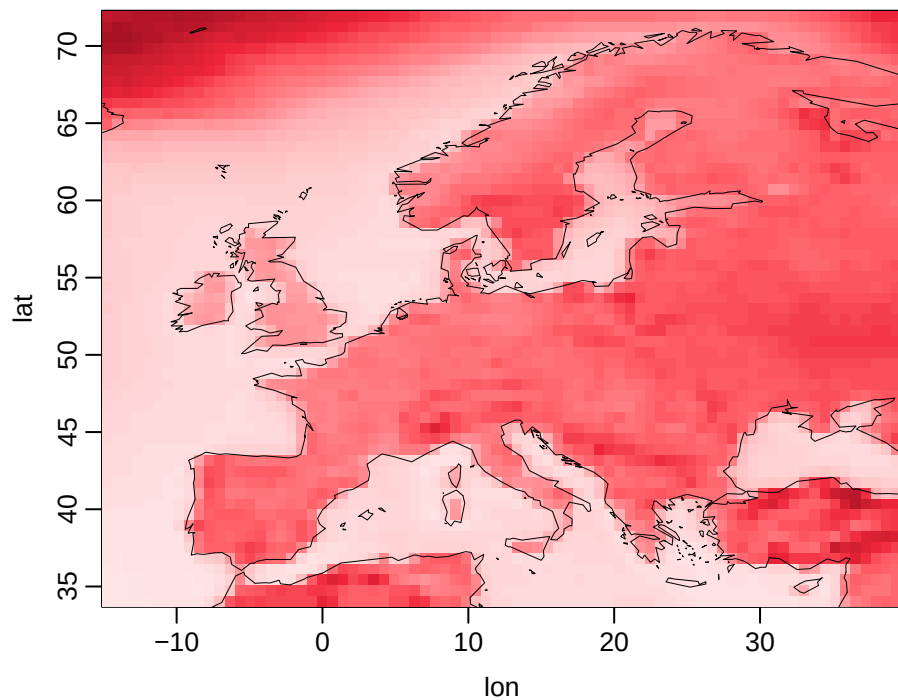

tasmax RMSE, worst month [K]

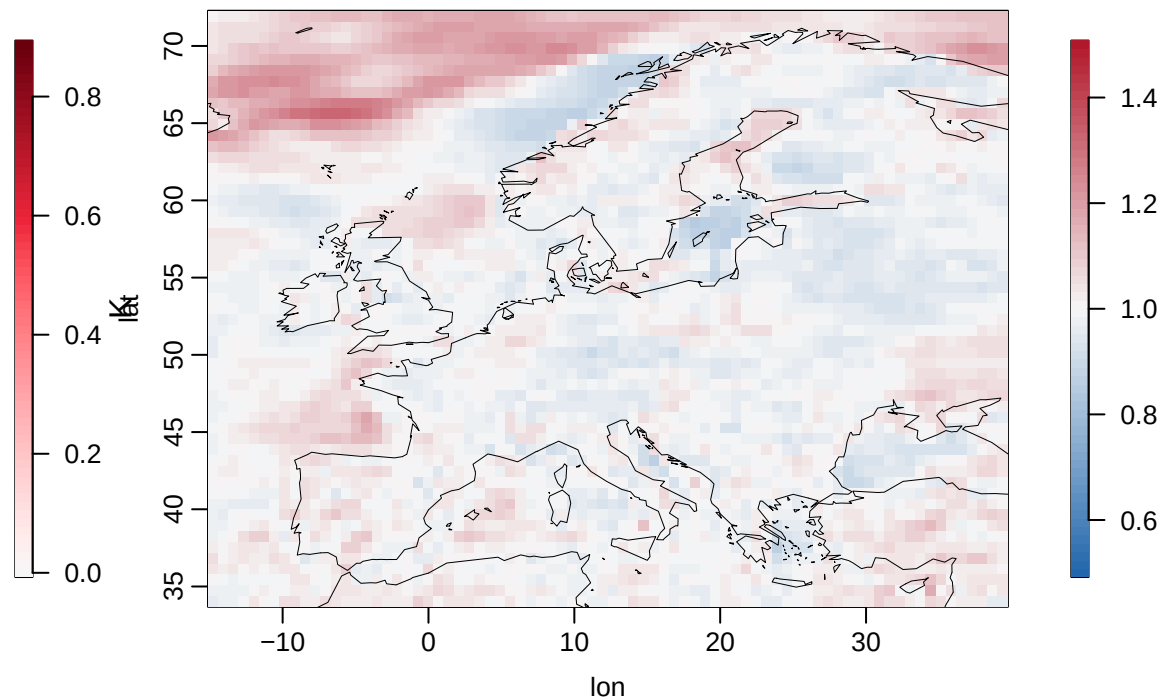

Temporal split-sample validation: fit on piControl years 1–250, scored on the rest (tests fit AND stationarity)

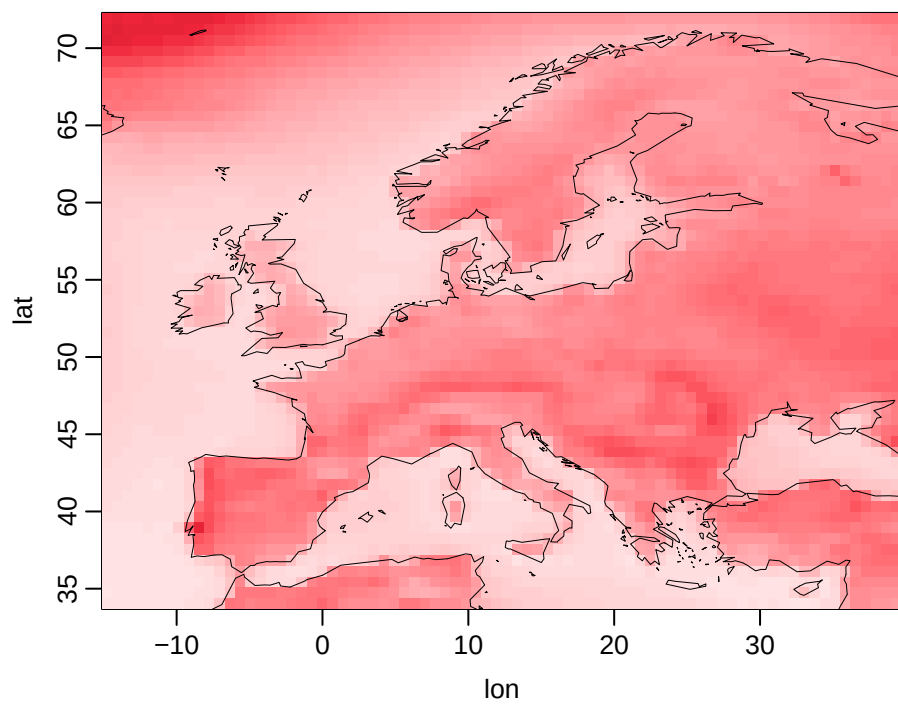

tasmin OUT-of-sample RMSE [K]

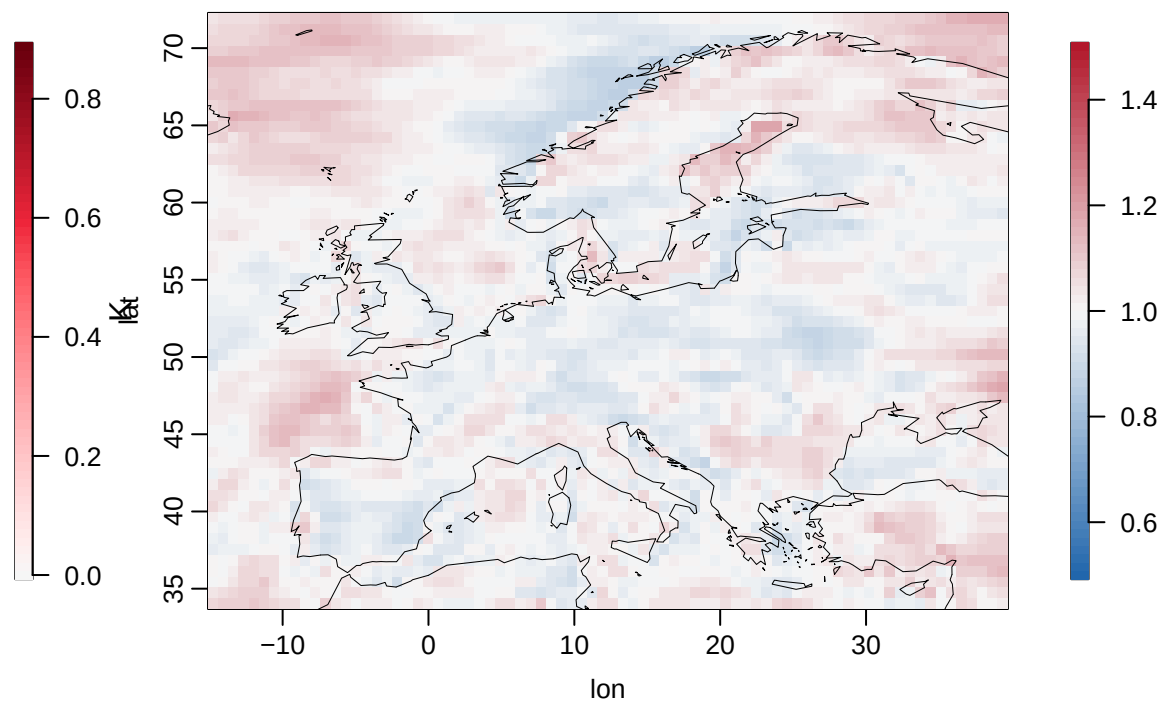

tasmin out/in RMSE ratio (1 = no drift)

tasmax OUT-of-sample RMSE [K]

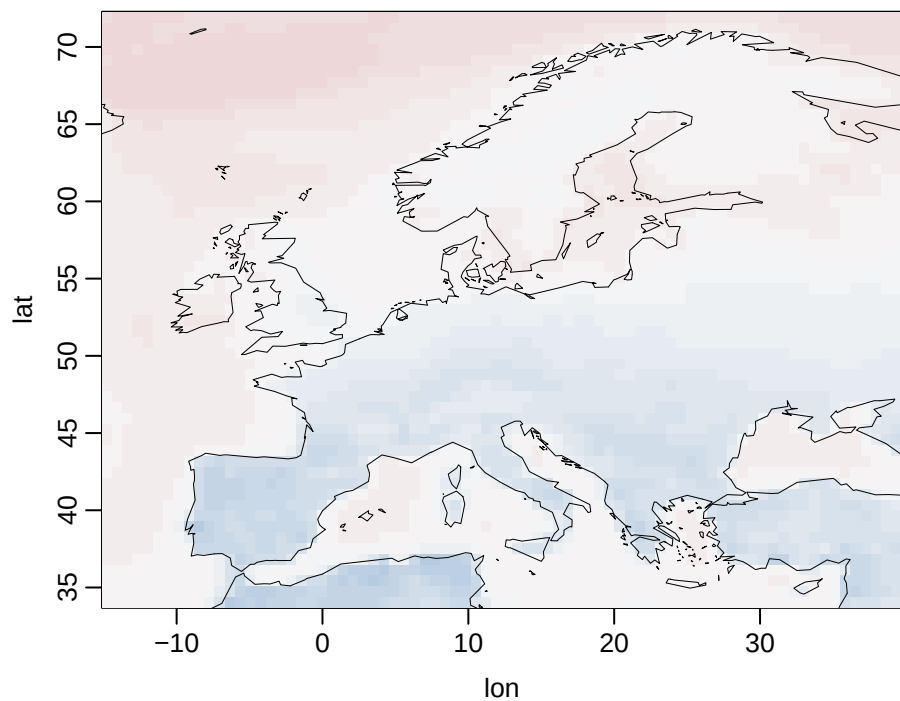

tasmax out/in RMSE ratio (1 = no drift)

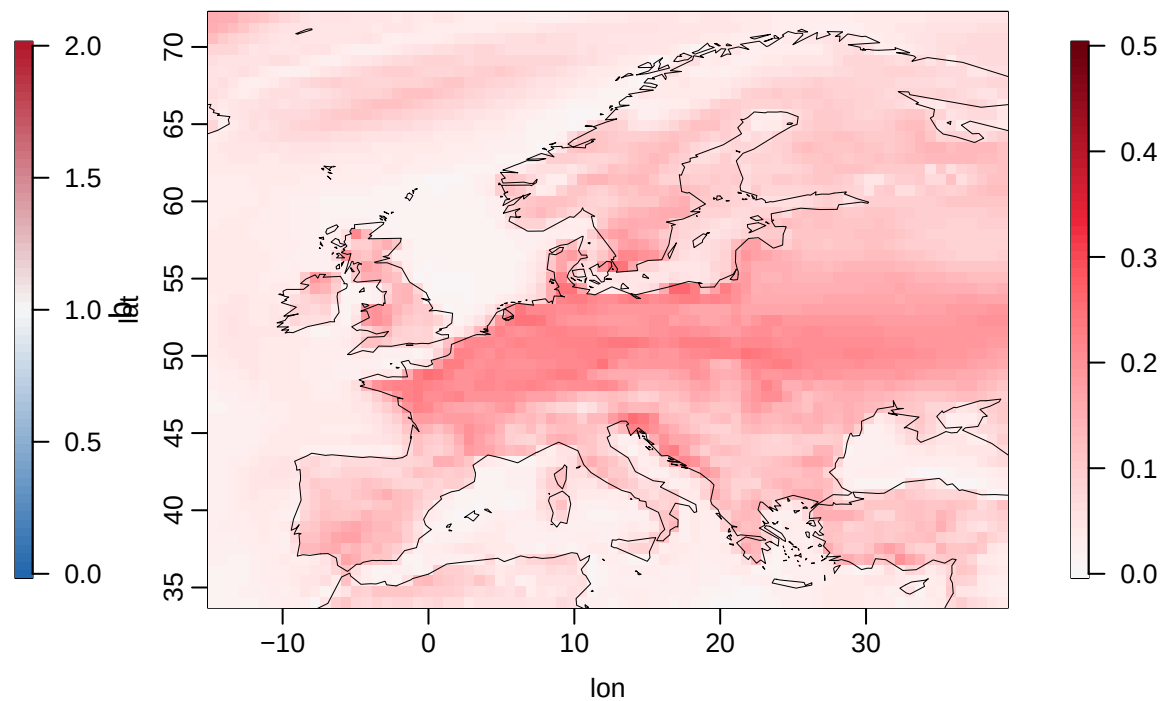

Fitted slopes (diverging scale centred on b = 1) and their seasonal spread

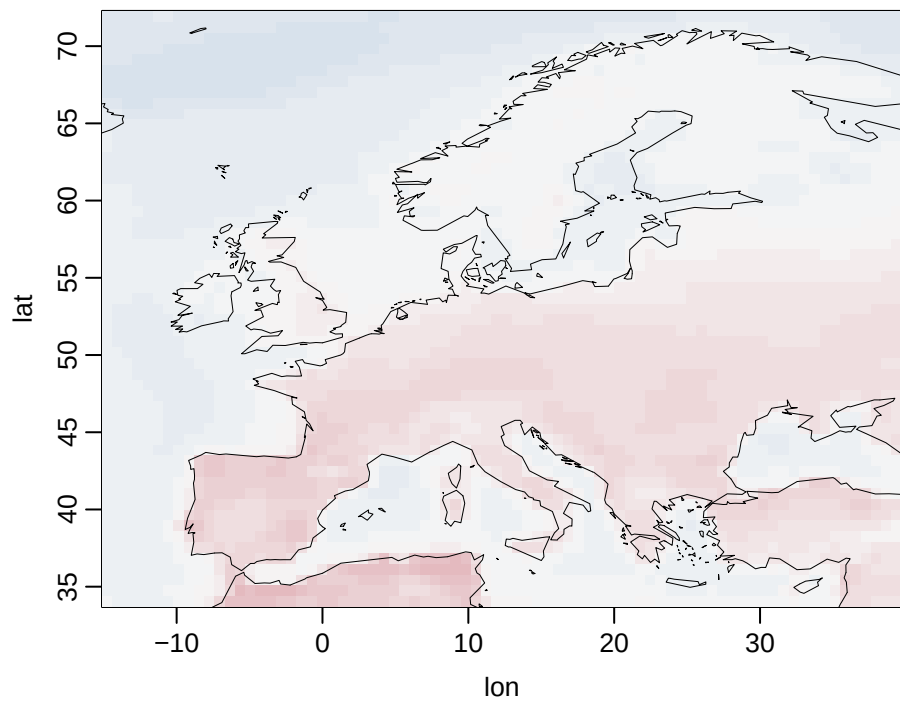

tasmin slope b, median month

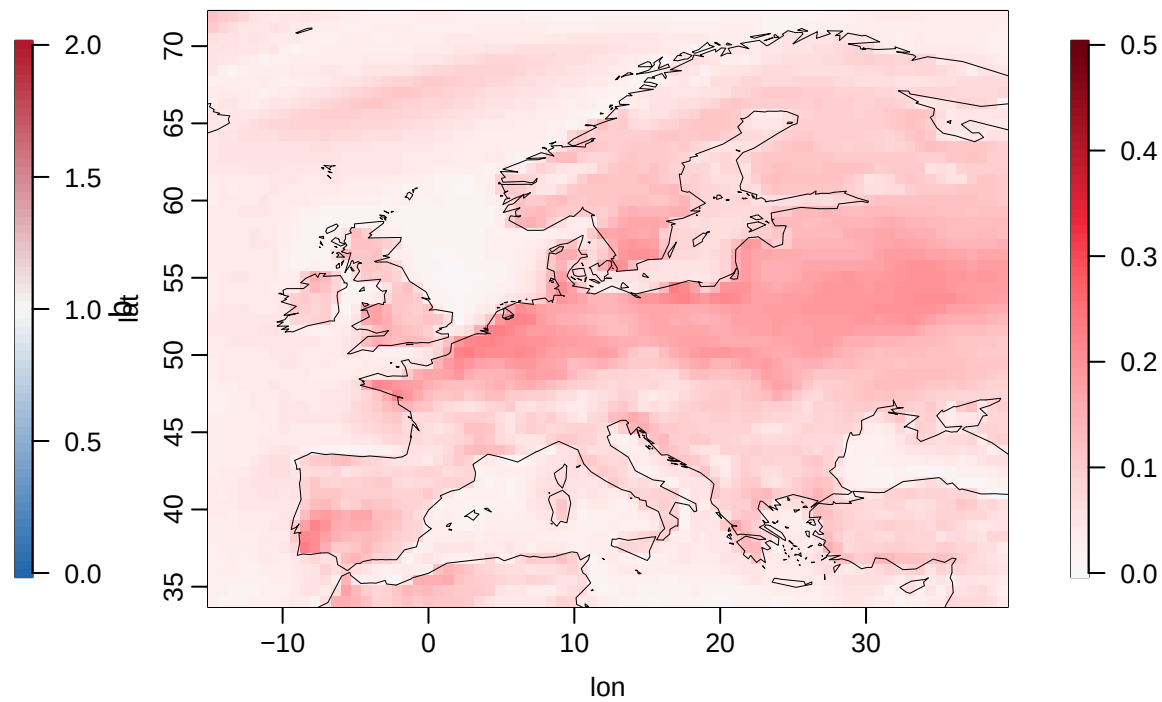

tasmin slope spread across months (MAD)

tasmax slope b, median month

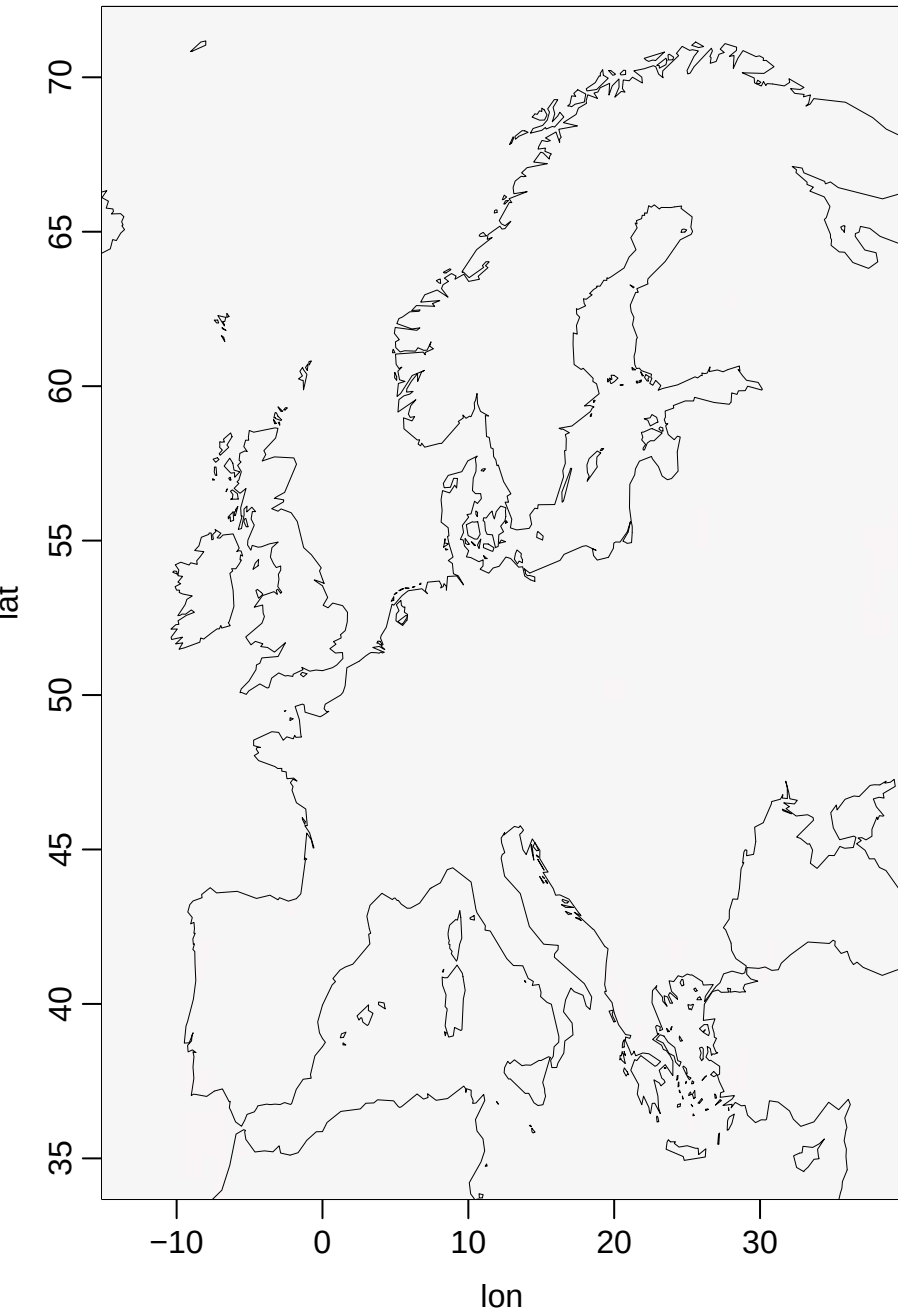

tasmax slope spread across months (MAD)

Extrapolation exposure: where the fitted line is evaluated beyond its training support

g01: % hosing months outside piControl range

u03: % hosing months outside piControl range
