

Crop yield effect vs AMOC-weakening bin (ΔSv)

solid = spec A (fixed Mar-Jul window, benchmark)

dashed = spec C (thermal-time window)

neither total is a standalone estimate (Appendix I) –
reported together so the specification sensitivity is visible

shaded band: range across the bin's individual hosing years,
spec A only, IPSL-CM6A-LR and EC-Earth3 (Appendix I)

vertical: ocean circulation, SAME run's single most extreme year –
NOT the 2071–2100 window the horizontal line uses (Appendix J, J.4c)

horizontal: the ISIMIP3b branch's own effect over 2071–2100
