

Crop yield effect vs AMOC-weakening bin (delta_Sv)

solid = spec A (fixed Mar-Jul window, benchmark)

dashed = spec C (thermal-time window)

neither total is a standalone estimate (Appendix I) –
reported together so the specification sensitivity is visible

shaded band: range across the bin's individual hosing years,
spec A only, IPSL-CM6A-LR and EC-Earth3 (Appendix I)

vertical: ocean circulation of that SAME run (ISIMIP has no ocean output);

horizontal: the ISIMIP3b branch's own effect at that warming (Appendix J)
